* For technical reasons POM should be used up to a maximum temperature of 80° C only. For higher temperature we recommend Aluminum/Steel.
** The maximum pressure allowance for dynamic and static application is dependent on the profile design.

The listed application parameters represent only a guide and should not occur simultaneously. Pressure, speed, temperature as well as the gap dimension, but also the fluid itself are determining factors which influence each other. The data refer to the generally valid and known data in the seal technology. By means of a careful selection of specific materials for the different applications the documented data may be optimized accordingly.

The seal geometries shown in the profile synopses are standard profiles. In addition, all the profiles can get adapted to special working conditions. Besides the listed standard profiles we deliver special profiles according to customer's drawings which match the individual requirements. All seals are turned workpieces up to an outside diameter of 1.850 mm and can get delivered with short notice.

The indicated minimum application temperatures are thought as a general guideline, because a seal's function at low temperatures is dependent on the kind of the seal, the general application conditions, and on the kind of the surrounding metal parts the seal is in touch with. The indicated upper temperature limits may be exceeded, but this reduces the service life. Other materials available on request.

In case of doubt you are always welcome to contact our application engineers.
